Q2

Hospital Patient Registration – User-Defined Exception

10
marks

Develop a Java program for a hospital patient registration system. The program accepts the patient's name, age, and body temperature.

Create suitable user-defined exception classes for invalid age and invalid temperature. Validate the input before registration. Use try-catch-finally and display a registration completion message from finally.

Sample Test Cases:

Input / Scenario Expected Result Purpose

Arun, 35, 98.6 Patient registered successfully Normal case

Meena, 12, 98.4 InvalidAgeException Boundary / exception case

Ravi, 45, 105.2 InvalidTemperatureException Invalid input

Kumar, -2, 98.1 InvalidAgeException Invalid input

Your Code

```
1 import java.util.Scanner;  
2 public class HospitalPatientRegistration  
3 {
```

```
4     static class InvalidAgeException extends
5     {
6
7     }
8     static class invalidtemperatureException
9     {
10
11     }
12     public static void main(String[] args)
13     {
14         Scanner sc = new Scanner(System.in);
15         int age = sc.nextInt();
16         String name = sc.next();
17         double temp = sc.nextDouble();
18         try
19         {
20             if(age<18)
21             {
22                 throw new InvalidAgeException();
23             }
24             if(temp<95||temp>100)
25             {
26                 throw new invalidtemperatureExce
27             }
28             System.out.println("successful");
29         }
30         catch(InvalidAgeException e)
31         {
32             System.out.println("invalid input");
33         }
34         catch(invalidtemperatureException e)
35         {
36             System.out.println("invalid input");
37         }
38         finally
39         {
40             System.out.println("completed");
41         }
42     }
43 }
```

Input

14
arun
98.6

Output

```
invalid input  
completed
```
